

Phrasing

Phrase =

a search term for which the exact character string entered is processed, even if there are spaces between the search words

- usually to be created with " " or « » or < >
- enables an exact search of the characters entered
- enables the marking of separated search words or word components as an inseparable and searchable unit

Example: "**manic depression**" or <**big bang**>

- Other techniques can be used within the phrase, such as truncation

Example: "**cold war***" or <**research organi?ation***>
